Dragon Project - User Manual

Carlone & Nordby

Prerequisites:

Users are assumed to have the following:

1) A compiler for the C language

2) The knowledge of Makefiles

3) To have downloaded all files in the project found on [Zingzingjr/dragon at semantics (github.com)](github.com)

How to use:

This compiler is for programs that follow the grammar from this link:

https://lin-web.clarkson.edu/class/cs445/grammar-23.txt

1) The user will create their program in a text file (e.g. program.txt).

2) The user will then use the `make` command to create the executable for the compiler.

3) When the user can see an executable file called `qc` the user can then use the command `./qc < program.txt` to get the assembly language for their program in an .s file.
